High-efficiency full-length cDNA cloning. Methods Enzymol. 303,
GAGAGAGAGAAGAGGCTCTTTTTTTTTTTTTTTTTTVN 3'], CDNA was prepared by using trebalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 20.0 and subtraction to Rot = 459.0. Second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in KIKEN. This cDNA sequence comprises the middle region of a cDNA clone of for murine Down syndrome cell adhesion molecule (DS-CAM), a commber of a novel subclass of the Ig superfamily with homology to come the cell adhesion molecules. The 5' region (see AAV31985) of the clone are also provided. The cell and 3' region (see AAV31987) of the clone are also provided. The cell and a cell adhesion molecules. The strong was isolated from a C57 Black/6 mouse brain cell and a cell and a cell as cell and availy 308 as cell as cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
This cDNA clone codes for Down syndrome-cell adhesion molecule CC DS-CAM2 (see AAW42087), an extracellular, soluble protein belonging CC to a novel subclass of the 1g superfamily with highest homology to CC to a novel subclass of the 1g superfamily with highest homology to CC technique was applied to bacterial and Pl artificial chromosomes CC technique was applied to bacterial and Pl artificial chromosomes CC between ETS2 and MX1 by using cDNA from trisomy 21 human foetal CC brain. A unique cDNA fragment, designated ES1 (see AAV31982), was CC brain and used to screen a trisomy 21 human foetal brain (14-wk CC obtained and used to screen a trisomy 21 human foetal brain (14-wk CC gestation) cDNA library. Further clones were obtained by exon CC trapping, and the complete DS-CAM2 cDNA sequence was identified. CC DS-CAM2 is a splice variant of membrane-bound DS-CAM1 (see AAW42086) and is deleted for the entire transmembrane domain. The DS-CAM cand is deleted for the entire transmembrane domain.

CC 21q22.2-22.3. The invention also provides murine US-CAM partial CC sequences (see AAV31985-87), expression vectors and host cells, cransgenic animals, antisense oligonucleotides, and primers useful CC transgenic animals, antisense oligonucleotides, and primers useful CC associated with developmental and neurological processes. They can CC methods of repairing (regenerating) damaged or severed peripheral CC methods of repairing (regenerating) damaged or severed peripheral CC nerves. The products can also be used in detection, diagnostis and CC therapy of developmental and neurological abnormalities such as CC therapy of developmental and neurological abnormalities such as CC the corpus callosum, or schizencephaly. Antisense oligonucleotides care used for inhibiting translation of mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ş

DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (regenerating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and therapy of developmental and neurological abnormalities such as therapy of mental retardation, holoprosencephaly, agenesis of Down syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides are used for inhibition translation of menns
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 6604 BP; 1673 A; 1827 C; 1768

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200153312-AI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.
                                            the encoded polypeptides (AAM384A2-AAM42233) with nootropic, the encoded polypeptides of the inventor and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotide in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as localised neuropathies, and shy-Drager Syndrome. Other uses include the lateral sclerosis, and shy-Drager Syndrome. Other uses include the lateral sclerosis, and shy-Drager Syndrome. Other uses include the activity of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic activity cancer diagnosis and therapy, drug screening, and assays for receptor activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes the human aortic preferentially expressed gene 1 (APEG-1) polypeptide, which is aorta specific and inhibits the growth of smooth muscle cells. The APEG-1 polypeptide can be used to inhibit vascular smooth muscle cell proliferation in an animal via its introduction into an artery of the animal. In an animal via the APEG-1 and the APEG-1 polypeptide can be products derived from APEG-1 and the APEG-1 polypeptide can be used to diagnose and treat vascular conditions, e.g. restenosis, atherosclerosis, transplant arteriosclerosis or diabetes. atherosclerosis, identified by differential expression in the aorta APEG-1 DNA, identified by differential expression in the aorta compared to ther organs, was used to obtain human APEG-1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20-JUN-1996;

The present sequence is a cDNA encoding aortic-preferentially-expressed components (APEC-1) protein from a human lambda gtl1 mortic 5'-stretch cDNA components (APEC-1) protein from a human chromosome 2933-34, components (APEC-1) protein isoforms, one specific to moscle cells designated APEC-1 protein and the other specific to components (APEC-1) protein can be administered to vascular smooth muscle cells (VSMC) to inhibit their proliferation or migration at the site of components (APEC-1) and the present sequence is used to screen VSMC-specific components (APEC-1) gene is useful to direct VSMC-specific expression. A components that bind to the repressor and components (APEC-1) gene is useful to discase such as alherosclerosis and restenosis.
                                                                                      RESULT 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The striated muscle preferentially expressed protein (SPEG) can be linked to an enhancer/promotor derived from an aortic preferentially expressed gene to regulate smooth muscle cell-specific expression. This can be used as a method of inhibiting vascular smooth muscle cell proliferation. The nucleic acids are used to direct developmental stage-specific expression of a heterologous polypeptide which is stage-specific expression of a heterologous polypeptide which is especially selected from tissue plasminogen activator (tPA), p21 cell expression, nitric oxide synthetase, gamma-interferon, atrial cycle inhibitor, nitric oxide synthetase, gamma-interferon, atrial cycle inhibitor, nitric oxide synthetase, gamma-interferon strial cycle inhibitor. These are used to inhibit the proliferation of smooth muscle cells, e.g. for the treatment of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                06-FEB-1997;

This protein was detected in striated muscles of skeletal and cardiac tissues. Was detected in striated muscle cell protein isoforms encoded by It is one of the two muscle cell protein isoforms encoded by the aortic-preferentially-expressed gene-1 (APEG-1) located on human chromosome 2q33-34. The other protein isoform is specific to aortic smooth muscle cells designated APEG-1 protein. The present sequence can smooth muscle cells designated APEG-1 specific-promoter which may be be used to identify striated muscle cell specific-promoter which may be used to direct gene expression in striated muscle cells to treat diseases associated with these muscles. APEG-1 gene is useful for treating and diagnosing vascular diseases such as atherosciarosis and

Two variants of HiskP are produced by P. falciparum. One is associated with what is referred to as "knobby phenotype" (K3) and associated with what is referred to as "knobby phenotype" (K3) and associated with what is referred to as "knobby and "knobless" phenotypes ("knobbes phenotype" (K-). The "knobby and "knobless" phenotypes of the pressing in cytoadherence, which is characteristic of the both K+ and K- HiskP can be obtained by the use of P. lophurae HiskP concerns the grounding the sended in two expressing that the sended to the sequence from the genome. The sequence of the protein occurs via the proposition, obtain probes spiritle bomologous DNA sequences in a confidence of the protein sequence. The sequence of mature proteins is arranged to the proposition and the sequence of mature proteins is arranged from unmerous tandem repeats with up to nine histidine residues in a confidence of the protein of the protein of the protein collect Plasmodium proteins for which sequence data

                                                                                                                                                                                                                                                                                             Ax The present sequence encodes an interferon omega-1 like protein, cc designated NoV2. The protein is a membrane bonn, a secreted protein. Cc designated NoV2. The protein is a membrane bonn, a secreted protein. Cc preventing a NOV-associated disorder, and in the manufacture of a preventing a NOV-associated disorder, and in the manufacture of a cc as NOV-associated disorder. They are also useful for treating disorders as NOV-associated disorder. They are also useful for treating disorders cc as NOV-associated disorder. They are also useful for treating disorders cc and activation of thymic immune cells, pathologies related to germatogenesis and male infertility, diagnosis of several human cc spermatogenesis and male infertility, diagnosis of several human cc such as red blood cells and platelets, various immunological disorders cand/or pathologies, autoimmune and inflammatory diseases, cardiovascular diseases, metabolic diseases, cancer growth and cells the control of the control of the control of the cardiovascular diseases, metabolic diseases, neurodecenerative disorders, and the control of the co
